### HOMEWORK 1

16824 VISUAL LEARNING AND RECOGNITION (FALL 2024)

https://piazza.com/cmu/fall2024/16824/

RELEASED: Wed, 18 Sept 2024 DUE: Wed, 2 Oct, 2024 Instructor: Jun-Yan Zhu TAs: Hsu-kuang Chiu, Yunus Seker

#### **START HERE: Instructions**

- Collaboration policy: All are encouraged to work together BUT you must do your own work (code
  and write up). If you work with someone, please include their name in your write-up and cite any code
  that has been discussed. If we find highly identical write-ups or code or lack of proper accreditation of
  collaborators, we will take action according to strict university policies. See the Academic Integrity
  Section detailed in the initial lecture for more information.
- Late Submission Policy: There are a total of 5 late days across all homework submissions. Submissions that use additional late days will incur a 10% penalty per late day.
- Submitting your work:
  - We will be using Gradescope (https://gradescope.com/) to submit the Problem Sets.
     Please use the provided template only. You do not need any additional packages and using them is strongly discouraged. Submissions must be written in LaTeX. All submissions not adhering to the template will not be graded and receive a zero.
  - Deliverables: Please submit all the .py files. Add all relevant plots and text answers in the boxes provided in this file. To include plots you can simply modify the already provided latex code. Submit the compiled .pdf report as well.

NOTE: Partial points will be given for implementing parts of the homework even if you don't get the mentioned accuracy as long as you include partial results in this pdf.

# 1 PASCAL multi-label classification (20 points)

In this question, we will try to recognize objects in natural images from the PASCAL VOC dataset using a simple CNN.

- Setup: Run the command bash q1\_q2\_classification/download\_data.sh to download the train and test splits. The images will be downloaded in data/VOCdevkit/VOC2007/JPEGImages and the corresponding annotations are in data/VOCdevkit/VOC2007/Annotations. voc\_dataset.py contains code for loading the data. Fill in the method preload\_anno in to preload annotations from XML files. Inside \_\_getitem\_\_ add random augmentations to the image before returning it using [TORCHVISION.TRANSFORMS]. There are lots of options and experimentation is encouraged. Implement a suitable loss function inside trainer.py (you can pick one from here). Also, define the correct dimension in simple\_cnn.py.
- **Question:** The file train\_q1.py launches the training. Please choose the correct hyperparameters in lines 13-19. You should get a mAP of around 0.22 within 5 epochs.

#### • Deliverables:

The code should log values to a Tensorboard. Compare the Loss/Train and mAP curves of
the model with and without data augmentations in the boxes below. You should include the two
curves in a single plot for each metric.

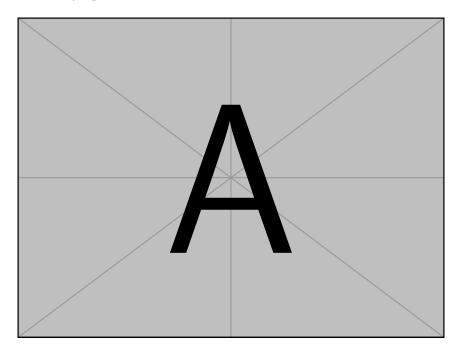

Figure 1.1: Loss/Train with and without data augmentations.

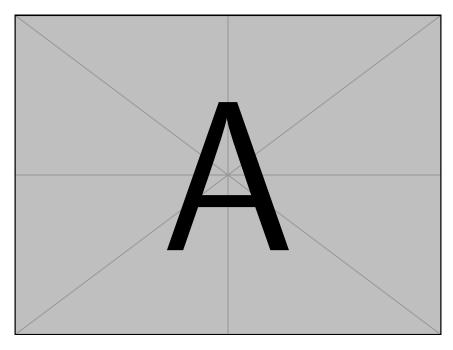

Figure 1.2:  $\mathtt{mAP}$  with and without data augmentations.

- Report the Loss/Train, mAP and learning\_rate curves of your best model logged to Tensorboard in the boxes below.

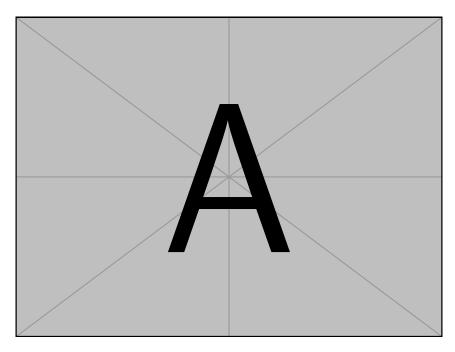

Figure 1.3: Loss/Train for simple CNN

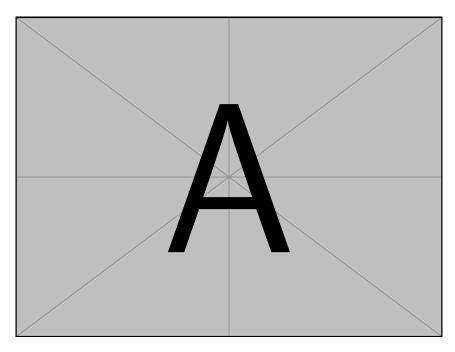

Figure 1.4: mAP for simple CNN

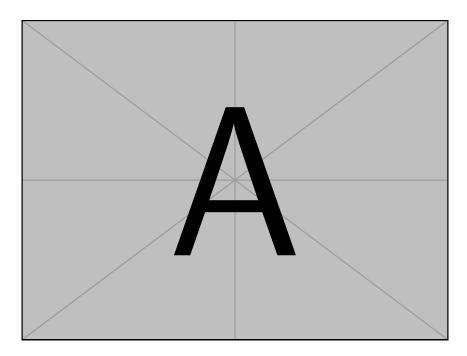

Figure 1.5: learning\_rate for simple CNN

 Describe the hyperparameters you experimented with and the effects they had on the train and test metrics.

<b>Solution:</b>			

# 2 Even deeper! Resnet18 for PASCAL classification (20 pts)

Hopefully, we get much better accuracy with the deeper models! Since 2012, much deeper architectures have been proposed. ResNet is one of the popular ones.

- Setup: Write a network module for the Resnet-18 architecture (refer to the original paper) inside train\_q2.py. You can use Resnet-18 available in torchvision.models for this section. Use ImageNet pre-trained weights for all layers except the last one.
- **Question:** The file train\_q2.py launches the training. Tune hyperparameters to get mAP around 0.8 in 50 epochs.
- **Deliverables:** Paste plots for the following in the box below.
  - Include curves of training loss, test MAP, learning rate, and histogram of gradients from Tensor-board for layer1.1.conv1.weight and layer4.0.bn2.bias.

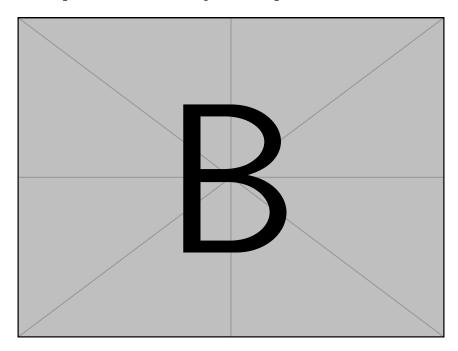

Figure 2.1: learning\_rate for ResNet

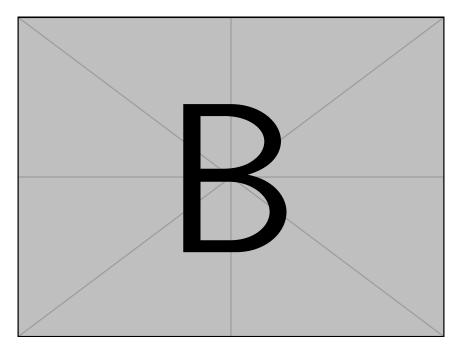

Figure 2.2: mAP for ResNet

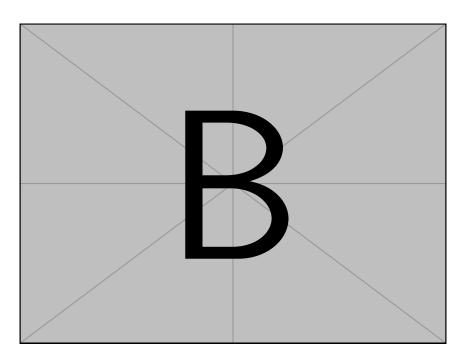

Figure 2.3: Loss/Train for ResNet

- How does the test mAP and training loss change over time? Why do you think this is happening?

<b>Solution:</b>			

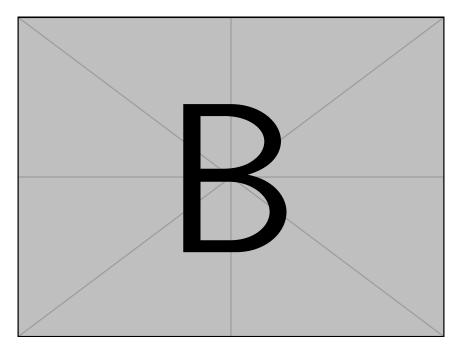

Figure 2.4: Histogram of Convl layer

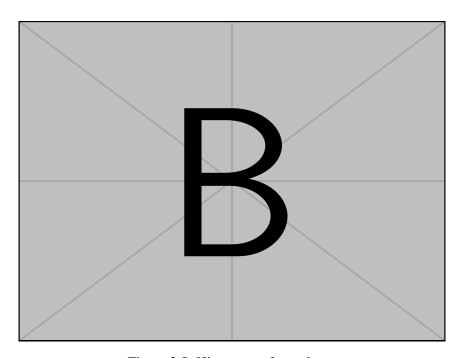

Figure 2.5: Histogram of BN4 layer

- Compare the two histogram plots. How do they change over time? Why do you think this is happening?

<b>Solution:</b>			

- We can also visualize how the feature representations specialize for different classes. Take 1000 random images from the test set of PASCAL, and extract ImageNet (finetuned) features from those images. Compute a 2D t-SNE (use sklearn) projection of the features, and plot them with each feature color-coded by the GT class of the corresponding image. If multiple objects are active in that image, compute the color as the "mean" color of the different classes active in that image. Add a legend explaining the mapping from color to object class.

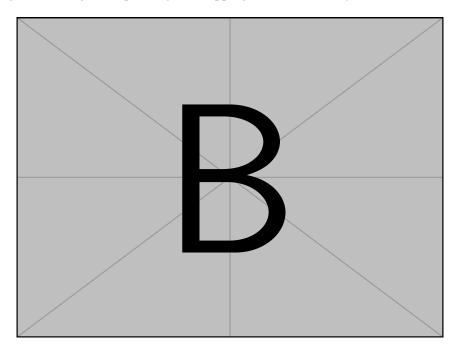

Figure 2.6: t-SNE

- Briefly describe what you observe in the t-SNE plot. Does this match your expectations?

Solution:			

# 3 Supervised Object Detection: FCOS (60 points)

In this problem, we'll be implementing supervised Fully Convolutional One-stage Object Detection (FCOS).

• **Setup**. This question will require you to implement several functions in detection\_utils.py and one\_stage\_detector.py in the detection folder. Instructions for what code you need to write are in the README in the detection folder of the assignment.

We have also provided a testing suite in test\_object\_detection.py. First, run the test suite and ensure that all the tests are either skipped or passed. Make sure that the Tensorboard visualization works by running 'python3 train.py -visualize\_gt'; this should upload some examples of the training data with bounding boxes to Tensorboard. Make sure everything is set up properly before moving on.

Then, run the following to install the mAP computation software we will be using.

```
cd <path/to/hw/>/detection
pip install wget
rm -rf mAP
git clone https://github.com/Cartucho/mAP.git
rm -rf mAP/input/*
```

Next, open detection/one\_stage\_detector.py and detection/detection\_utils.py. At the top of the files are detailed instructions for where and what code you need to write. Follow the README and all the instructions for implementation.

#### · Deliverables.

It's always a good idea to check if your model can overfit on a small subset of the data, otherwise
there may be some major bugs in the code. Train your FCOS model on a small subset of the
training data and make sure the model can overfit. Include the loss curve from over-fitting below.

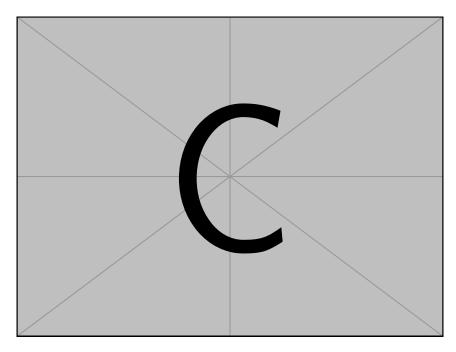

Figure 3.1: Overfitting Training Curve

- Next, train FCOS on the full training set and include the loss curve below.

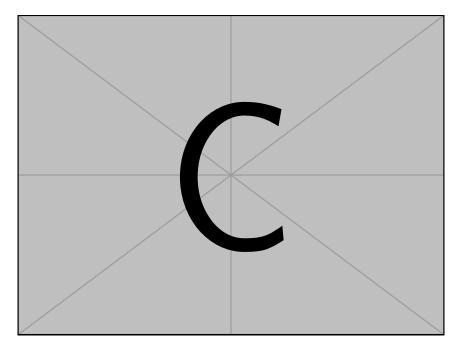

Figure 3.2: Full Training Curve

- Include the plot of the model's class-wise and average mAP. If everything is correct, your implementation should reach a mAP of at least 20.

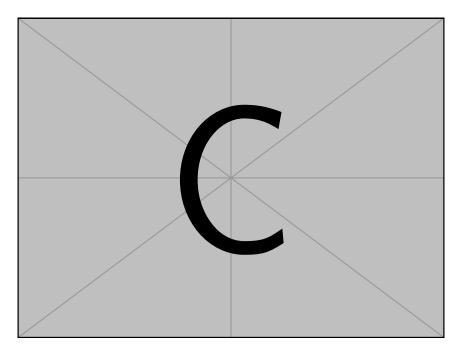

Figure 3.3: mAP plots

- Paste a screenshot of the Tensorboard visualizations of your model inference results from run-

ning inference with the --test\_inference flag on.

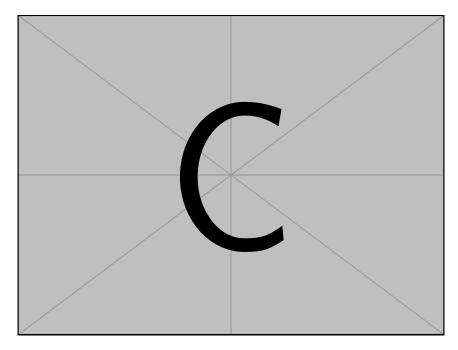

Figure 3.4: Tensorboard Inference Visualization

- What can you conclude from the above visualizations? When does the model succeed or fail? How can you improve the results for the failure cases?

<b>Solution:</b>		

### Collaboration Survey Please answer the following:

1. Did you receive any help whatsoever from anyone in solving this assignment?
○ Yes
○ No
• If you answered 'Yes', give full details:
• (e.g. "Jane Doe explained to me what is asked in Question 3.4")
2. Did you give any help whatsoever to anyone in solving this assignment?
○ Yes
○ No
• If you answered 'Yes', give full details:
• (e.g. "I pointed Joe Smith to section 2.3 since he didn't know how to proceed with Question 2"

3. Note that copying code or writeup even from a collaborator or anywhere on the internet violates the Academic Integrity Code of Conduct.
